Announcements Week_10_11_12 - Big Data Processing

=== Week 12 Q&A Sessions (2026-10-07) ===
Hi all,

Since we do not have tutorial material scheduled for Week 12, we will use Week 12 as a Q&A week.

Three Q&A sessions will be available:

-
Monday, 10:30 AM - 14.10.030

-
Tuesday, 4:30 PM - Online via Collaborate Ultra

-
Friday, 10:30 AM - 08.08.045

The regular practical classes run by Ke and Xikun in Week 12 will not take place.

However, Ke's online lectorial (Tuesday 12:30) will run as usual. Ke will talk about A4 during the lectorial. DO NOT MISS THIS CLASS!!!!

Please attend any of the Q&A sessions above if you need help or have questions.

During the sessions, I will also talk about A4 and, for a bit of fun, we will solve the following puzzle:

You have 1,000 bottles, and exactly one bottle contains a non-fatal poison. The poison takes 59 minutes to take effect, and you have only 60 minutes in total, so you can perform only one round of testing.
What is the minimum number of mice required to identify the poisoned bottle?

Regards,

COSC2633/2637 Teaching Team

=== Week 11 practical class: monitoring HDFS (2026-10-01) ===
Hi all,

Do not skip Week 11 tutorial class, it offers a starting point for your A3.

We will learn how to use spark-submit command, which is a powerful tool for running Spark applications locally or in a cluster. Note: we do not use HUE this year, please always use "hadoop fs -put" to upload files to your HDFS :-)Links to an external site.

We'll discuss A3 in the tutorial; please read the spec beforehand and bring your questions.

We are looking forward to seeing you all in the classes.

=== Week 10 practical class: Scala Maven Project on IntelliJ IDEA (2026-09-24) ===
Hi all,

We provided a step-by-step demonstration during the Week 9 online practical. If you are still having difficulty completing the Week 9 lab exercise, please follow the class recording available in CU, as it walks through the required steps in detail.

We will create an executable Jar for monitoring a socket on localhost in Week 10 practical class.

You will first need to run Netcat (a small utility found in most Unix-like systems) as a data server by using

nc -lk 9999

Then, in a different terminal, you can start the example by using

java -jar count-week8.jar localhost 9999

Any lines typed in the terminal running the netcat server will be counted and printed on screen every second.

We will look at:

- How to use SparkConf to provide configuration parameters.

- How to create a SocketTextStream DStream that represents streaming data from a TCP source.

- Difference between RDD and DStream.

- streamingContext.start() and streamingContext.awaitTermination()

Regards,

COSC2633/2637 Teaching Team
